

## **Eventz is a website that allows its users to register for the latest events in a given place.**

We do not yet have a company branding, so we will need both the web design and the website development. The features we need for our new website are as follows:

- The only thing a visitor can do is see the events.
- A visitor should sign-up or sign-in in order to register for an event.
- A visitor should sign-up or sign-in to see who is registered for an event.
- A User should be able to filter events by
  - their date - whether they have already passed or not
  - their price - whether they are free or not
- A User should be able to register for an event.
- A User should be able to unregister from an event.
- A User should be able to see who is registered for a given event.
- A User should be able to like an event.
- A user should be able to remove their like for an event.
- The user profile page should display the events for which the user is registered.
- The user profile page should display the events which the user has liked.
- The event show page should display a list of users who have liked the event.
- A User should be able to edit, update, and delete their account from the website.
- The event show page should indicate when an event has no spots left and thus not allow other people to sign up.
- In case a user unregisters from an event, their spot should be available again.
- An Admin User should be able to create, edit, update and delete an event.
  - An Admin User should be able to unregister a user from an event.
- The website should be hosted and we should be able to access it using a domain.

We are looking for an estimated project cost and a timeline.

Thank you,

The Eventz team
